

### Low-Fidelity Shopping Cart Page

For the initial paper low-fidelity sketch I decided to keep the basic page layout the same and have a clear title on the top letting the shopper know that they are now viewing their shopping cart. I decided to keep everything in a list format to make it easier for the shopper to quickly scan over their items and then preview their subtotal at the bottom of the list. It would be easier to follow the convention of viewing a receipt in the real world of seeing the item picture, quantity and price on the right hand side, before viewing the subtotal at the bottom.

## High-Fidelity Shopping Cart Page

For the shopping cart page, I decided to keep to the same basic layout as the other pages in order to ensure consistency. I wanted to make sure the shopper knew what could be edited and what could not be edited when previewing their cart before checking out. The shopper would be able to remove items and edit the quantity. I decided to include the drop down selector, to make it easier for the user to adjust their quantity upon reviewing the cart and there is a box around the remove to show them they can press it to remove that item. The viewer can then read down vertically view their subtotal, shipping cost and total before clicking checkout. The image on the left is a banner to help keep the shopper engaged during their checkout process, and can also be used to show any upcoming promotions for the holidays.
